

THE CLAUDE BEAST

/team-review: Agent Team Code Review

Three Parallel AI Reviewers. One Comprehensive Report.

Security | Performance | Test Coverage | Zero Config

What Is /team-review?

A single command that deploys three specialist reviewers in parallel

Core Concept

Spawns 3 independent Claude Code instances via Agent Teams, each with its own context window and specialized review criteria. Results are synthesized into a single prioritized report.

Security

1

- Injection vulnerabilities
- Auth/authz gaps
- Data exposure risks
- Hardcoded credentials
- CSRF/SSRF risks

Performance

2

- React re-renders
- N+1 database queries
- Missing pagination
- Bundle size impact
- Memory leaks

Test Coverage

3

- Missing test files
- Edge case gaps
- Integration testing
- Stale/outdated tests
- Business logic coverage

Architecture: Five-Step Pipeline

Built on Claude Code Agent Teams | All state stored as JSON on disk

Key Architecture Properties

- Each agent has its own context window -- no cross-contamination between reviewers
- Agents communicate via shared mailbox system for coordination
- Token usage is ~3x a single session (one full Claude instance per reviewer)
- TeamDelete cleans up all resources automatically after synthesis

Installation & Usage

Prerequisites

- Claude Code CLI installed and configured
- GitHub CLI (gh) authenticated
- Agent Teams enabled in settings.json

Enable Agent Teams

```
{ "env": {  
  "CLAUDE_CODE_EXPERIMENTAL_AGENT_TEAMS":  
    "1"  
}}
```

Install (Interactive)

```
git clone  
https://github.com/startappdev/agents.git  
cd agents && ./install.sh
```

Interactive installer creates directories,
checks dependencies, sets permissions

Usage

```
/team-review
```

Combined Workflow

```
/team-review (pre-PR comprehensive review) → Push PR → /greptile-review-loop (auto-fix & merge)
```

The startappdev/agents Ecosystem

Agents, Commands, and Hooks -- a curated review toolkit

Agents

~/.claude/agents/

greptile-review-loop.md -- autonomous review agent

code-fixer.md -- single-file targeted fix agent

Commands

~/.claude/commands/

/team-review -- 3 parallel reviewer agents

/greptile-review-loop -- auto review-fix-merge

Hooks

~/.claude/hooks/

post-pr-greptile-hook.sh -- notifies user

after PR creation to run review loop

End-to-End Autonomous Review Pipeline

Write Code → /team-review (pre-PR) → Push PR → /greptile-review-loop (auto-fix) → Merge (score ≥ 4/5)

Review Output: Consolidated Report

Report Structure

- Security Findings -- grouped by severity
- Performance Findings -- with impact analysis
- Test Coverage Findings -- with remediation paths
- Overall Assessment -- prioritized action items
- File references with line numbers
- Concrete remediation suggestions

Example Finding

```
## Security: SQL Injection Risk
Severity: HIGH
File: src/api/users.ts:42
```

```
Raw user input passed directly
to query builder without
parameterization.
```

```
Fix: Use parameterized queries
via db.query($1, [userId])
```

Key Insight

Three specialist reviewers consistently surface issues that single-pass reviews miss -- each agent focuses deeply on its domain without distraction from other dimensions.

Cost & Optimization

TOKEN USAGE

Solo review

~200K tokens

1x

/team-review

~600K tokens

~3x

9-agent system

~1.8M tokens

~9x

WHEN TO USE /TEAM-REVIEW

- **Before creating a PR** — catch issues early
- **After significant refactors** — verify no regressions
- **Security-sensitive changes** — dedicated security focus
- **Performance-critical paths** — dedicated perf analysis
- **New team members** — comprehensive quality check

Optimization Strategies

- **Use Opus for lead, Sonnet for reviewer teammates** — significant cost reduction
- Run /team-review selectively on complex changes, not every commit
- Combine with /greptile-review-loop to avoid duplicate manual review effort

Why /team-review Matters

Zero-Config Specialist Review

One command deploys three focused reviewers. No setup, no arguments, no configuration files needed.

Agent Teams Architecture

True isolation via independent Claude instances. Each reviewer focuses deeply without cross-contamination.

End-to-End Pipeline

/team-review (pre-PR) + /greptile-review-loop (post-PR) = fully autonomous code quality.
